SQL CFG _Project

Project : Hospitals

Name of student : Ludivine Chabaud

Summary : In my database, only three hopsitals are left in the world (kinda of apocalyptic) : Darwin Hospital in Australia, Molchanova Hospitalin Thailand, and Paoli Hospital in France.

The database 'hospitals' will show the fees that patients have in those 3 hospitals.

Hospital fees encompass entry fees, the room fees, the medical bill and the special meal orders.

- **Medical Bills :** All medical bills have to be approved by a doctor. Each doctor work in one and only one hospital. Doctors can be specialised in either : « injury » or « disease ».
- **Food :** Basic meals are included in the hospital's entry fees. If a patient wants a special meal, he has to pay for it. A list of 9 special meals are listed including burger, pizza, Christmas meals and champagne.
- **Room :** Patients choose their room according to what they want to pay.

Seven tables have been created and linked through primarykey/foreign key constraints :
